221601504 PROGRAMMING WITH PHP
Lab Exercise-10, Session and Cookies

1. Session Login Example

- Create a login form (username & password).
 - If correct, store the username in a session variable and display a welcome message.
 - Provide a logout option that destroys the session.
-

2. Session Counter

- Create a program that counts how many times a user has refreshed a page using session variables.
 - Display the count value each time the page loads.
-

3. Modify and Unset Session Variables

- Start a session and store `name` and `email` in session variables.
 - Modify the `email` value on the next page.
 - Later unset only the `email` variable while keeping `name`.
-

4. Cookie Creation & Expiry

- Create a cookie named `user` that stores a username for 1 day.
 - Display the stored value on page refresh.
 - Then delete the cookie by setting its expiry time in the past.
-

5. Remember Me Feature (Cookie)

- Create a login form with a “Remember Me” checkbox.
- If checked, store the username in a cookie so that it auto-fills next time.
- If not checked, do not store any cookie.
