PRACTICAL CEC

Create a dataset:

Years at Company={2,4,3,8,1,5,6,7,10,2,2}

Job Satisfaction = {65,85,72,90,50,80,NAN,92,95,60,65}

Left of company = {1,0,1,0,1,0,0,1,0,1,1}

Write a machine learning code to:

- **Create a DataFrame** from the data provided using pandas.
- Preprocessing
 - Remove duplicate data
 - print first 5 rows
 - Replace mean value if there is NULL
 - Implement min-max Scaling
- **Divide the data into training and testing**
- **Train the model** using **Decision Tree** to predict if an employee will leave the company based on Years at Company and Job Satisfaction.
- **Evaluate the model** by calculating the accuracy of the model on the given data.
